We decided to create a chatting platform like Discord using JavaScript. However, unlike Discord which is gamer-oriented, our platform, Educord, is student-oriented. The users have to login using the Google sign in page first, and then they are taken to the home screen where they have access to:

- A personal calendar to which they could add events.
- A personal to-do list to which they could add tasks.
- A list of servers which represent different courses/classes, which each contain several chatrooms dedicated to a specific topic related to the course, like homework help or exam preparation. The user may also add or delete servers or rooms within them.
